Introducing **MaxGlow**

Halo Creations, a division of Plas-Tech, introduces **MaxGlow**, an exciting new line of LED edge-lit acrylic signage which offers a multitude of applications for indoor use.

MaxGlow utilizes high intensity, low voltage LED technology to create brilliant, eye catching signage that will draw your customers attention to your product or logo. **MaxGlow** Signs will energize your marketing campaign, draw attention to your corporate identity, and brilliantly brand your product.

MaxGlow offers various configurations, including hanging, stand-off mounted, and base supported designs. Applications include Feature Boards, Corporate identity, POP Signage, Bar signage, Interior design elements, Trade show booths, and Temporary signage, just to mention few. Computer-controlled engraving produces crisp, clean images with optimum visibility. The acrylic faces can create dynamic shapes to enhance your message. The ultra-slim housing gives a streamlined appearance with no bulkyness.

MaxGlow Signs are the ideal choice for both permanent and portable signs. LED technology uses as little as 20% of the power required by neon signage. Low power consumption translates into greatly reduced electrical costs. The low-voltage LED signage does not require any special installation qualifications.
